

Intro:

Hello, welcome to the React Burger Kitchen (workshop...). Today we'll be building this burger: <https://digital-e.github.io/reactburger/>

We will be able to change the colour of the top, and bottom buns, choose the vegetables by *swiping* (Onions, Tomato, or Salad), and add more Fauxmage (vegan cheese) by clicking! If you're really quick, and think this isn't challenging enough, feel free to experiment with the burger and modify other things.

1.)

All you need to do is clone the code from my Github (<https://github.com/Digital-E/reactburger>), by entering this in your console in the place you would like to clone the project:

```
git clone https://github.com/Digital-E/reactburger.git
```

It will appear in a folder named: "reactburger"

Enter:

```
cd reactburger
```

To get to that folder.

2.)

Create your own repo in Github, then push the code to your own repo.

Follow these steps:

```
git remote rm origin  
git remote add origin "your repo url"  
git add .  
git commit -m "First Commit"  
git push -u origin master
```

3.)

Then follow these two tutorials to get it all set-up!

1. Follow "ReactBurger - StoryBlok Setup"

2. Follow “React Burger - React App Setup”

If you would like to push your burger to GitHub Pages and show it to your friends once you’ve finished, follow this tutorial:

<https://dev.to/yuribenjamin/how-to-deploy-react-app-in-github-pages-2a1f>
